# CITYMIND

*Turn urban challenges into buildable solutions.*

From a recurring civic problem to a Bob-ready build specification — and the working app Bob built from it.

---

IBM Bob 2.0 Hackathon · Sept 25–27, 2026 · Hyderabad, India

# A civic problem that keeps recurring — and stays undocumented

Yousufguda & Erragadda, Hyderabad. Residents and shopkeepers report the same two junctions flooding every monsoon — but the reports live in WhatsApp groups, not a system anyone can act on.

**2018 → 2026**

years of recurring incidents

**12**

current citizen reports this season

**4**

historical sources connected

**3**

junctions mapped to real coordinates

*The gap isn't awareness — it's structure. Nobody has turned "this keeps happening" into evidence, a pattern, and a spec anyone could build against.*

# CityMind: structure first, then build

A working pipeline, not a mockup — every step below runs in the app today.

*Most Bob submissions are "I used Bob to build X." This is a two-stage story: a tool that turns a real problem into the exact spec Bob needs — then Bob builds the result.*

# Evidence, AI interpretation, and unknowns — never blurred together

CityMind's analysis step labels every claim by its source — so a municipal team never mistakes a guess for a fact.

## From evidence

- Culvert narrowed by 2021 road-widening
- Debris blocking drain inlets
- Rainfall bulletins align with report timestamps

## AI interpretation

- 1998 drainage design may be undersized
- Upstream development may raise runoff

## Information gaps

- No continuous water-level data
- Drainage capacity data unavailable
- Little data outside major storms

# The Solution Blueprint: FloodWatch

A build-ready specification — not a pitch idea. This is the artifact CityMind hands to Bob.

### Core features

- Incident reporting
- Interactive incident map
- Severity classification
- Photo / location evidence
- Response tracking
- Municipal dashboard
- Historical analytics

### Data model

**Incident**

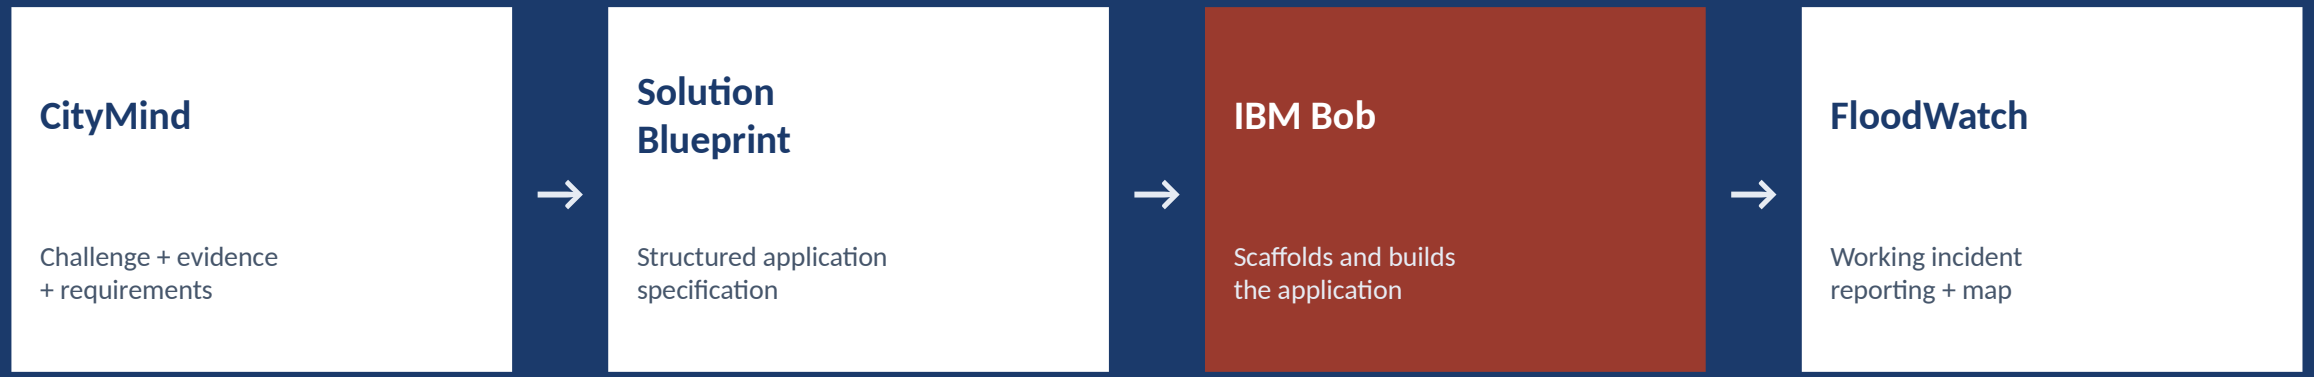

```
location, latitude, longitude
severity, status, photo
timestamp, description
```

**Response**

```
incident_id, assigned_team
status, notes, updated_at
```

# Built with Bob — not just designed for it

CityMind hands off a complete, structured spec — Bob scaffolds and builds FloodWatch from it.

*Session evidence for this handoff lives in /bob_sessions in the project repository.*

# Built for the people who actually respond to this

**Municipal teams**

See verified incidents on a map, assign response, track resolution — not a spreadsheet of WhatsApp screenshots.

**Field workers**

Report and verify incidents from the location itself, with photo evidence attached.

**Civic organizations**

Bring historical records and community reports into one place, with clear evidence trails.

**Citizens**

Report what they see once, to the right place, instead of a group chat no one tracks.

# CityMind + IBM Bob

*Structure the challenge. Build what cities need.*
